The Smart Energy Home: Strategies for the Region

Claire Miziolek
Market Strategies Program Manager
Northeast Energy Efficiency Partnerships
October 28th, 2016
About NEEP

Mission

Accelerate energy efficiency as an essential part of demand-side solutions that enable a sustainable regional energy system

Approach

Overcome barriers and transform markets via *Collaboration, Education and Enterprise*

Vision

Region embraces **next generation energy efficiency** as a core strategy to meet energy needs in a carbon-constrained world

One of six regional energy efficiency organizations (REEOs) funded by the US Department of Energy (US DOE) to link regions to US DOE guidance, products and programs
Background

Energy (Efficiency)

IoT

Opportunities for Home Energy Management Systems (HEMS) in Advancing Residential Energy Efficiency Programs
August 2013
New Report!

- *The Smart Energy Home: Strategies to Transform the Region*
- Released in early October, 2016
- ~30 pages with short executive summary
- READ IT!
Energy efficiency of consumer electronics creates some unique challenges. Many traditional efficiency program approaches are not easily transferable to electronics due to the rapidly changing technology, the shrinking energy consumption between efficiency and inefficient options, consumers not recognizing efficiency as a priority and a relatively small annual financial savings per efficient product compared to the purchase price. Recognizing the need for a solution, NEEP worked with its allies to develop the Regional Demo and...
The Smart Energy Home: Strategies to Transform the Region

October 2016
Today’s Agenda

- Technology and Market Characterization
- Key market barriers to accelerated adoption
- Market opportunities to leverage
- Long-Term Market Transformation Goal
- Strategies for success to reach the regional goal
Technology and Market Characterization: Report Highlights
What is the Smart Home?

Home Energy Management Systems (HEMS):
• Any hardware and/or software system that can:
  – monitor and provide feedback about a home’s energy usage,
  and/or
  – enable advanced control of energy-using systems and devices in the home

Image credit: Icon.asid.org
Definitions: HEMS vs. Smart?

Going a step further, “smart” systems monitor energy use and:

While HEMS can be any end use, for the focus of this report, we’re focusing on the major household energy using systems: HVAC, Water Heating, and Plug Loads
Standby Power

• Most smart products operate in an “always on” mode
  – ready to receive or send a signal
• .1-2W range on average
  – can be larger for major equipment
• The more energy intensive the equipment, the relative significance of standby load decreases
• BUT standby load for small wattage devices can be hard. Smart lamps may be a significant challenge:
  – For an 8.5W LED (60W equivalent), .5W is 47% energy increase, 1W is 94% energy increase, and 2W is 188% energy increase

Energy benefit from smart device > Standby power
Size and Scope of Smart Home Market

From: Sylvania Socket Survey
Recent Trends and Market Disruptors

- Touch-control devices
- Li-fi
- Hub-less smart lightbulbs, connect directly with a smart phone app
- Voice Recognition devices
## Smart Energy Potential

Market Barriers and Opportunities
Programs

Barriers:
• Limited energy savings potential for all products except smart thermostats, which has unreliable individual savings
• Smart energy products are difficult to evaluate
• Equity challenges—these are expensive, non-critical devices

Opportunity:
• Program administrators already have appliance, lighting, and water heater rebates
Customer

Barriers:
• Low awareness
• Security concerns
• Device set up and ease-of use may not be ready for the mainstream
• Wi-Fi is a common protocol, but imperfect in application.

Opportunity:
• Interest in, and demand for, smart home technologies is increasing
• Voice-controlled interface devices are surging in popularity
• Home Security is a motivator for investment
Technology

Barriers:
- Interoperability

Opportunity:
- R&D continues, new and interesting devices entering the market
Grid

Barriers:
• AMI infrastructure is inconsistent throughout region

Opportunity:
• Increased need to manage peak electricity use/residential demand response
• Increase appetite for distributed energy resources

Region's AMI Penetration (Electric 2014)

- Non-AMI Meters
- AMI Meters
Market Transformation Goal
Regional Market Transformation Goal

Truly smart homes will delight the resident and optimize the energy components of a home

*Regional Goal:* By 2030, more than 50% of total homes (75% of new construction) in the Northeast and Mid-Atlantic have at least two "energy smart" major systems (HVAC, water heating, plug load). This means they:

1. **Optimize major system energy savings**
2. **Can optimize distributed energy resources**
3. **Can optimize devices for the grid (through time-of-use pricing, load shifting, demand response)**
4. **Can drive other home improvements through a feedback mechanism**
Market Transformation Curve

HEMS Market Transformation Curve

- Business as Usual
- Intervention

Strategies for Success
Two Schools of Thought

1. Push: This is a great opportunity that we need to push, likely won’t success without us

2. Pull: This market is moving and there are benefits that we don’t want to let pass us by, pull ourselves onto it
1. Leverage any HEMS infrastructure to drive home efficiency improvements.
   - Use the user interface to include information about home performance offerings and upgrades. Use comparative norms to motivate action.
   - Market the right decision maker—smart device owners are not necessarily home improvement centric. Gender dynamics.
   - HELMS = Home Energy Labeling Management Systems

2. Smarten water heating.
   - Retrofits, incorporate into on-site visit program, turn existing water heaters into DR ready, smart water heaters.
   - Integrate smart water heaters with other HEMS to optimize performance. HEMS could send price signals or follow an expected demand curve to optimize WH schedule, “vacation mode,” occupancy information
   - Promote connected functionality in new water heating equipment, especially heat pump water heaters.
3. Adjust savings expectations for smart thermostats, then put into permanent programs

- The DR potential of smart thermostats is clear, but for energy savings, PAs and regulators should shift to an aggregated savings approach across a service territory to realistically evaluate savings
- Lean heavily on the ENERGY STAR process to get state-wide savings estimates

4. Smart appliances, water heaters, and lighting should be promoted in existing programs

- These smart products have smart energy home potential.
- PA should not lose the opportunity to promote the smart versions of these products in existing programs
- Look towards pilots to prove both energy and grid benefits
5. Develop strategies to seriously engage with service providers in the IoT space, especially home security.

  – These “nontraditional” market actors are moving a lot of products,
  – efficiency stakeholders need to strategically build partnerships with them, not try to complete.

6. PAs diversify support of HEMS from strictly monetary incentives to other support features and roles.

  – Smart Energy Audit program: on-site visit to help with the installation and set-up of any hardware or software within the home.
  – Programs play the role of ongoing energy advisor for smart systems and HEMS, could include a call support center.
  – Partner! Retailers, HEMS vendors, help advance the development of some of the less obvious smart products, such as water heating and appliances. Shifting program intervention upstream?
  – Add it to realtor engagement for efficiency
  – PAs pilot new products and opportunities.
7. Investigate user friendly technologies, such as voice control.
   
   – Huge opportunity exist to increase persistence of scenes and energy efficient settings through more fool-proof technologies. Efficiency stakeholders should partner with players such as Amazon, Google, Apple.

8. Promote dynamic energy pricing to help make all other strategies more impactful.
   
   – Dynamic pricing will amplify the return on investment for most HEMS, and policymakers, regulators, and utilities should work to promote the adoption on dynamic pricing rate structures.
Call to action

• NEEP is actively seeking project funding to advance several of these strategies, specifically:
  – Smart Water Heating Initiative
  – HEMS to drive Home Performance
  – HEMS Working Group

• To get involved or talk further, contact Claire Miziolek, cmiziolek@neep.org
Conclusion

• Thank you to all LAC members and report reviewers!
• Read the report! Report, this slideshow, recorded webinar:
  – http://neep.org/smart-energy-home-strategies-transform-region
• Any Questions?
THANK YOU!

This is an ongoing initiative and we welcome your participation. To get involved, contact:
